

**ShadowVault**  
— PROTOCOL —

**Trade in *Shadows*. Leverage Fearlessly**

# Who are we?

ShadowVault Protocol is a **privacy**-focused decentralized trading platform built on Ethereum.

It combines **zero-knowledge** privacy mechanisms, deep Uniswap liquidity access, and AI-powered trading agents.

The protocol enables **shielded** spot and leveraged trading while maintaining composability and transparency at the settlement layer.

## **Vision** & Core Concept

Public **DeFi** trading exposes wallet history, positions, and behavioral patterns.

ShadowVault **restores** privacy as a fundamental primitive while maintaining deep liquidity and decentralization.

Core pillars:

- **Zero-Knowledge** Privacy
- Uniswap **Liquidity** Access
- **AI Trading** Agent Power

## **Trading** Platform with Ai assistance

**Shadow Vault** Protocol offers a state of the art trading platform focused on privacy. A specialized Ai assistant can analyse the users performance **if** the user wants it.

After analysis the assistant **can** offer the tips and new trading opportunities specialised for the users needs and interests.

Users are completely free to choose if they want to use the AI assistant. The assistant is available for **SVP** token holders.

# Roadmap

## Phase 1: Foundation & Testnet

Q1 2026 (Now – March 2026)

- Build the zero-knowledge privacy system (your trades stay hidden)
- Connect to Uniswap for deep liquidity without exposing your wallet
  - Launch private testnet for shielded spot trading
    - Complete first security audit
- Run the 90-day declining auction (presale is live now!)

## Phase 2: Core Features & Beta

Q2 2026 (April – June)

- Add leveraged trading (up to 100×) with safe liquidation rules
  - Release the first AI trading agents (smart bots that work privately for you)
- Fully launch Proof Pods staking (Bronze, Silver, Gold tiers)
  - Open public beta testnet + start bug bounty rewards
    - Begin early community voting

## Phase 3: Mainnet Launch

Q3 2026 (July – September)

- Go live on Ethereum mainnet
- Full shielded spot + leveraged trading available
  - AI agents fully active and user-controlled
- Activate DAO governance so SVP holders decide future updates
  - Complete second full security audit

## Phase 4: Growth & Expansion

Q4 2026 and Beyond

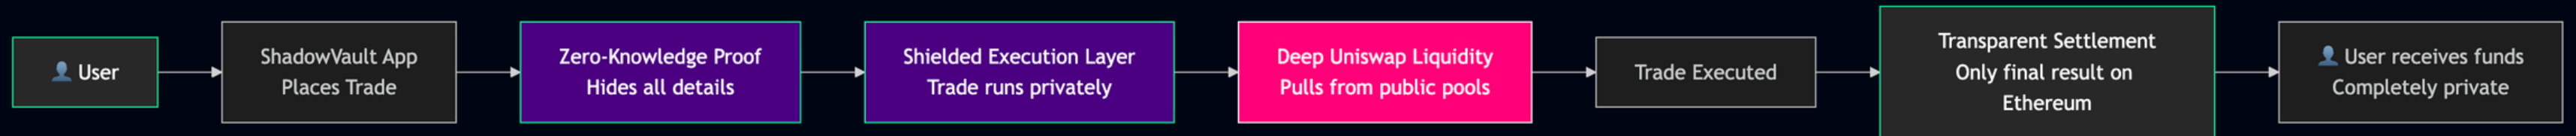

- Add support for faster/cheaper chains (BSC, Layer-2s)
  - Upgrade AI agents with more strategies
- Introduce fee sharing and token burns to grow SVP value
  - Build partnerships and keep improving the platform

We will update this roadmap regularly on our website, X, and Discord. All dates are estimates — we move only when everything is secure and tested.

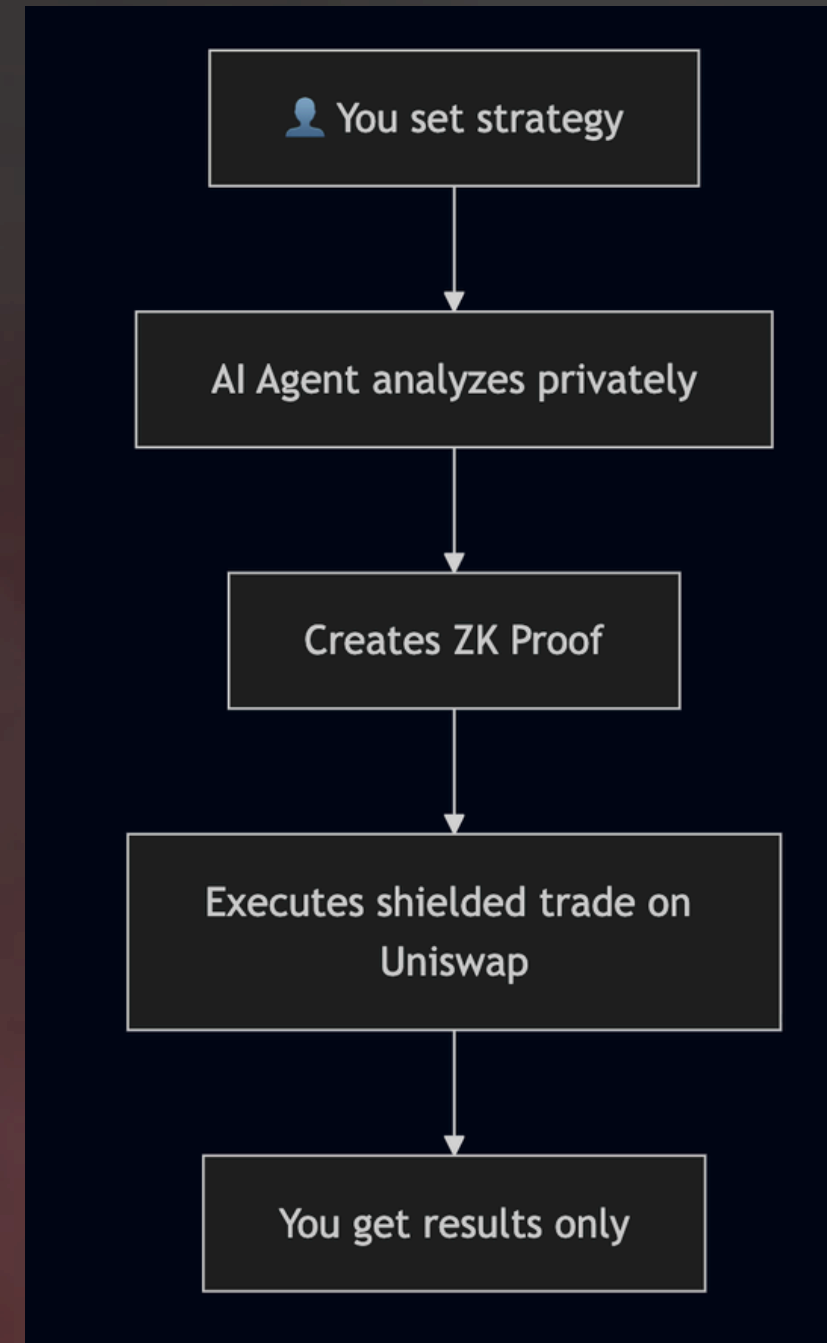

# Shielded Trade Flow

Here is an example of a user executing a trade on the platform.

# Shielded Trade Flow

Here is an example of how a user utilises our AI assistant for a shielded trade using the strategy analysis.

# Token Overview

Token **Name:** ShadowVault Protocol

Symbol: **SVP**

Network: Ethereum (ERC-20)

Total Supply: 1,000,000,000 SVP (fixed)

# Token Utility

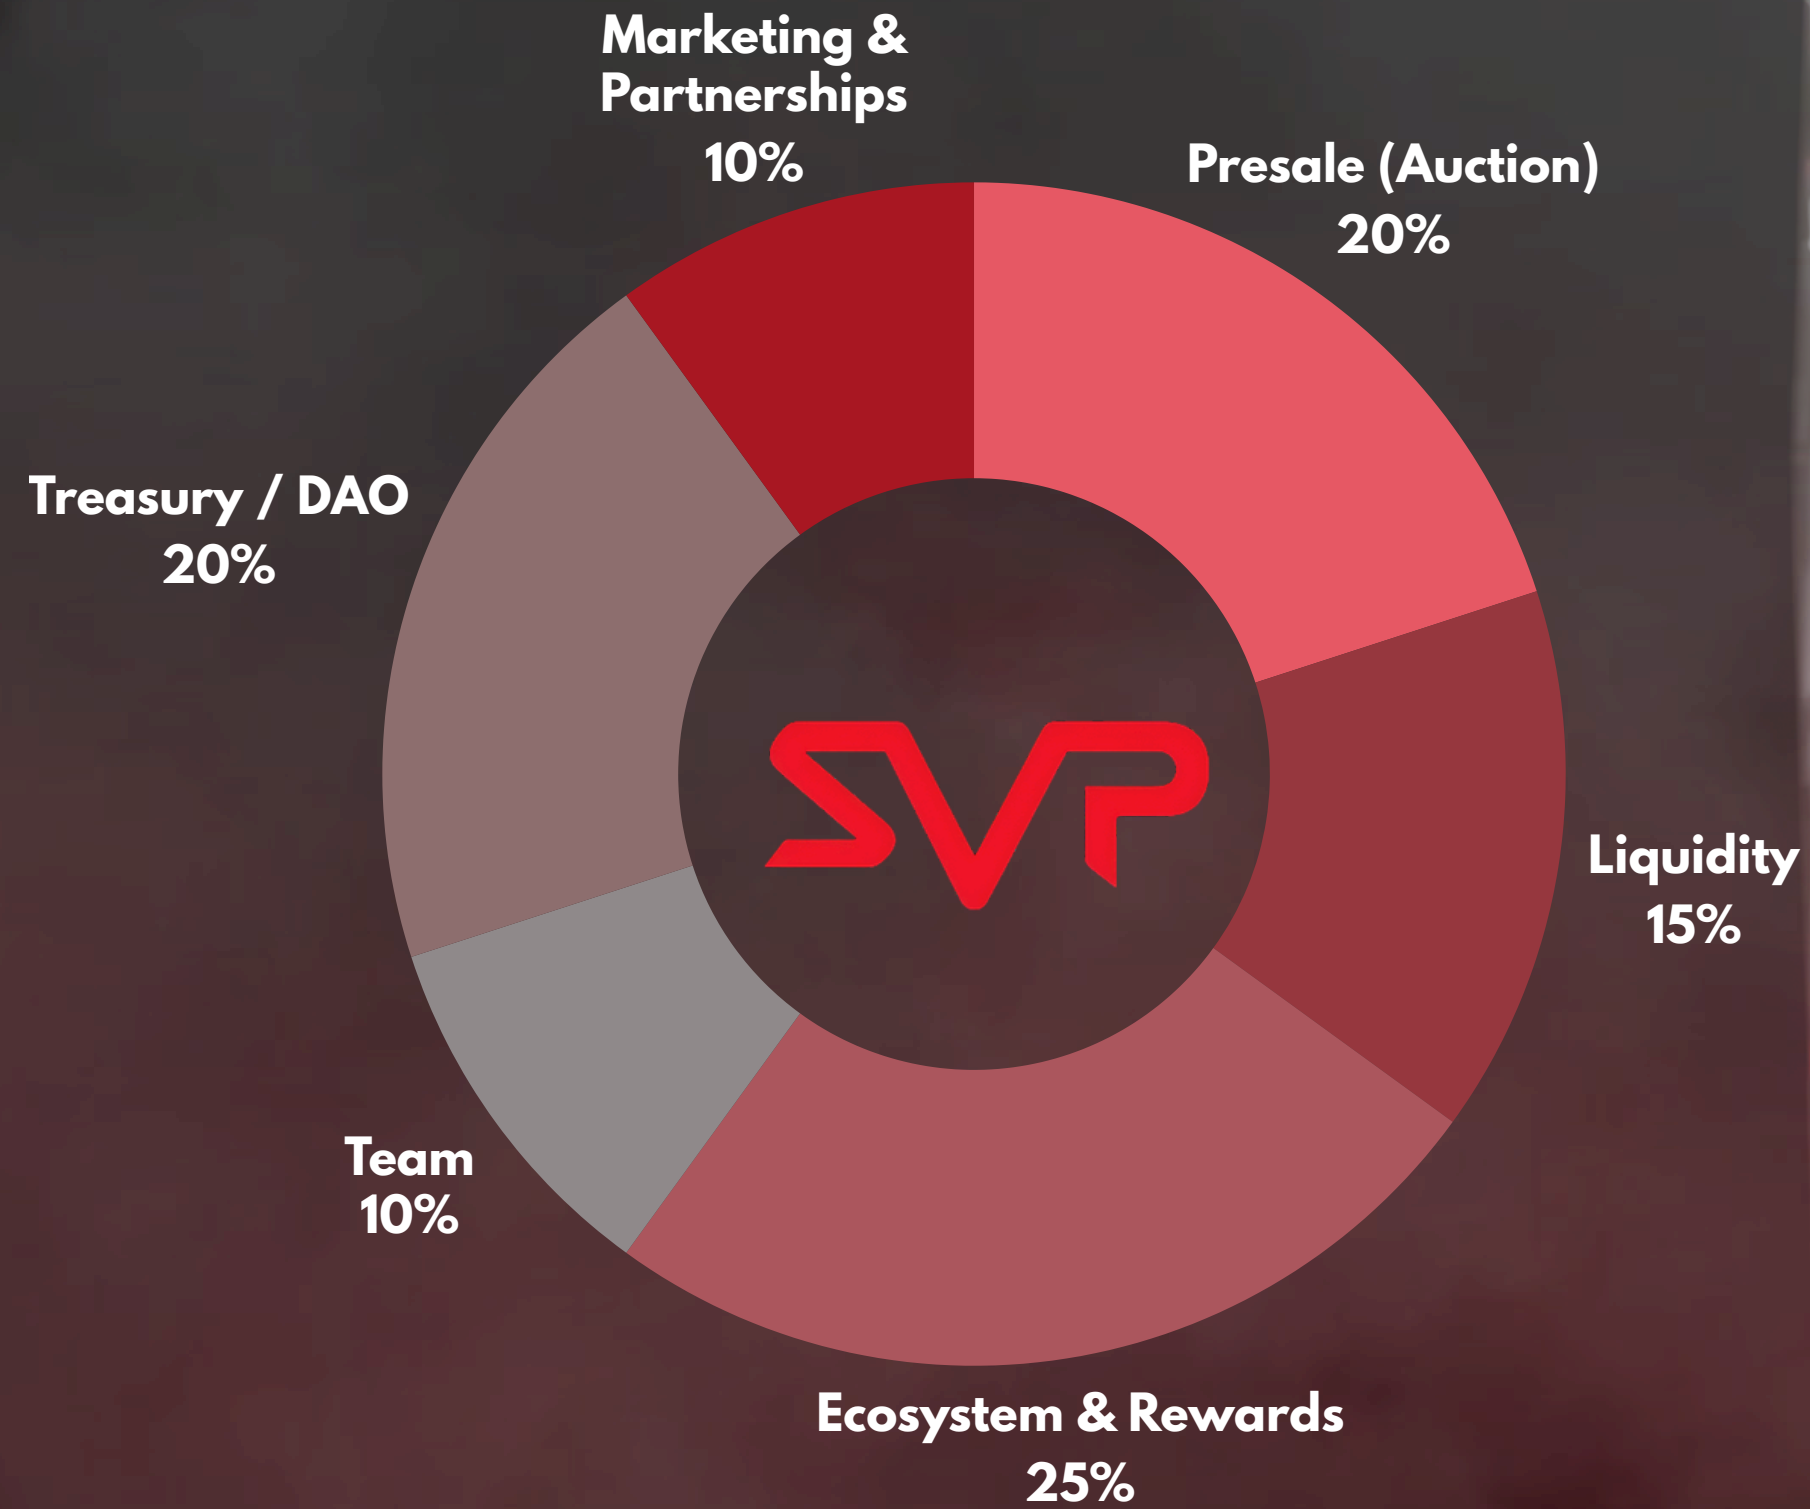

**\$SVP** is more than just a token — it gives you real power in ShadowVault:

- Trading fee discounts (the more you stake, the less you pay)
- Governance voting (help decide protocol updates and treasury use)
- Premium AI Trading Agent features (unlock smarter bots)
- Staking rewards from the ecosystem pool

Holders who stake in Proof Pods (Bronze, Silver, Gold tiers) also earn extra bonuses and multipliers.

# Token Allocation

# **Vesting** & Unlock Schedule

## **Presale** Participants:

- **10% unlocked at TGE**
- **90% vested linearly over 90 days**
- **Claims occur on **Ethereum** only**

## **Team Tokens:**

- **12-month cliff**
- **24-month linear **vesting** thereafter**

# Governance & DAO

After mainnet, full control moves to the community.

- **SVP** holders vote on key decisions (fees, new features, treasury spending)
- Easy proposal system — anyone with enough staked **SVP** can suggest changes
- Starts with a safe multisig, then becomes fully decentralized **DAO**

Your voice shapes the future of **private** DeFi.

# **Presale Mechanism**

## **90 Day Declining Auction**

**Auction Duration: 90 Days**  
**Daily Reset: 00:00 UTC**

**Accepted Chains: Ethereum & BSC**

**Accepted Assets:**

- **Ethereum: ETH, USDT, USDC**
- **BSC: BNB, USDT, USDC**

**All allocations settle into SVP on Ethereum.**

## **Daily** Token Emissions:

Day 1: 3,200,000 **SVP**

Day 90: 1,244,444 **SVP**

Total **Presale** Allocation: 200,000,000 **SVP**

Token Emission Formula:

$\text{tokens}(\text{day}) =$

$$3,200,000 - (3,200,000 - 1,244,444) \times (\text{day} - 1) / 89$$

**Price** Discovery Formula:

$$\text{price\_per\_token} = \text{total\_USD\_that\_day} / \text{tokens\_that\_day}$$

User Allocation Formula:

$$\text{user\_SVP} = (\text{user\_USD} / \text{total\_USD\_that\_day}) \times \text{tokens\_that\_day}$$

# Target **Raise** & Price Expectations

**Minimum** Raise: \$1,000,000

Target Raise: ~\$2,000,000

Expected **Starting** Price: \$0.004–\$0.006

Projected Late Auction Price: \$0.08–\$0.15

# Referral Program

Users can share a referral link which grants them a bonus on buys but also gives the buyer itself a bonus.

Buyer Bonus: +2% **SVP**

Referrer Bonus: +3% **SVP**

Bonuses are distributed from the Ecosystem allocation and do **NOT** affect auction supply.

Bonuses follow the same vesting schedule as presale allocations.

# Proof Pods **Staking** System

Users can stake their tokens in a special way via Proof Pods. These pods give users extra tokens and privileges on the platform like lower fees and extra AI trading options.

**Bronze Tier:**  $\geq 10,000$  SVP  $\rightarrow +2\%$

**Silver Tier:**  $\geq 50,000$  SVP  $\rightarrow +5\%$

**Gold Tier:**  $\geq 200,000$  SVP  $\rightarrow +9\%$

**Early Participation Multiplier:**  $1.5\times$  (Day 1) to  $1.0\times$  (Day 90)

**Pod Bonus Formula:**

**pod\_bonus = auction\_tokens  $\times$  tier\_bonus  $\times$  early\_multiplier**

## **Security** & Audits

**Security** is our top priority:

- **All** smart contracts and ZK circuits will be audited by top firms (PeckShield or equivalent)
- Public bug bounty program (earn rewards for finding issues)
- Regular updates to **protect** against new risks
- Leveraged trading includes clear warnings and safe liquidation rules

We never launch until everything is fully tested and **verified**.

# Risk Disclosure

High **leverage** trading carries significant risk and may result in total loss.

100× leverage is **optional** and only available for holders of the SVP token. High leverage trading is also accompanied by explicit risk warnings.

Participants are responsible for their **own** decisions.

# Conclusion

ShadowVault Protocol merges:

Privacy

AI intelligence

Deep liquidity

Into **one** single decentralized platform.

It **restores** confidentiality while preserving fairness and transparent price discovery.

Everything **you** knew, is about to change...
